

CSC 589 Introduction to Computer Vision

Lecture 21: Homographies

Bei Xiao

Rest of the topics

- Last class: April 27 or 30th?
- Final project due: May 4th.
- Image Alignment and RANSAC (next week)
- Camera models and projection (20th)
- Intro to machine learning and recognition (24th and 27th, 30th?)

Project 4: local feature matching

Due April 24th

green color: good matches
red color: bad matches

Steps

- Interest Point Detection (Harris corner detection)
- Local Feature Descriptions (SIFT)
- Feature matching (ratio test)

<http://www.cs.ubc.ca/~lowe/keypoints/>

http://en.wikipedia.org/wiki/Scale-invariant_feature_transform

Use of the stencil code

- Run Proj2.py in terminal. This code contains the basic structure and calls the functions you need to implement.
- Run show_gourd_truth_corr.py to view the ground-truth data.
- Implement get_interests_points.py
- Implement get_feats.py (SIFT features)
- Implement match_features.py

What is the geometric relationship between these two images?

Answer: Similarity transformation (translation, rotation, uniform scale)

All 2D Linear Transformations

- Linear transformations are combinations of ...

- Scale,
- Rotation,
- Shear, and
- Mirror

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

- Properties of linear transformations:

- Origin maps to origin
- Lines map to lines
- Parallel lines remain parallel
- Ratios are preserved
- Closed under composition

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} e & f \\ g & h \end{bmatrix} \begin{bmatrix} i & j \\ k & l \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

Homogeneous coordinates

Trick: add one more coordinate:

$$(x, y) \Rightarrow \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

homogeneous image
coordinates

Converting *from* homogeneous coordinates

$$\begin{bmatrix} x \\ y \\ w \end{bmatrix} \Rightarrow (x/w, y/w)$$

Translation

- Solution: homogeneous coordinates to the rescue

$$\mathbf{T} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} x + t_x \\ y + t_y \\ 1 \end{bmatrix}$$

Affine transformations

$$\mathbf{T} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix}$$

any transformation with last row $[0 \ 0 \ 1]$ we call an *affine* transformation

$$\begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix}$$

Basic affine transformations

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Translate

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Scale

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} \cos\theta & -\sin\theta & 0 \\ \sin\theta & \cos\theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

2D *in-plane* rotation

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & sh_x & 0 \\ sh_y & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Shear

Affine Transformations

- Affine transformations are combinations of ...

- Linear transformations, and
- Translations

$$\begin{bmatrix} x' \\ y' \\ w \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

- Properties of affine transformations:

- Origin does not necessarily map to origin
- Lines map to lines
- Parallel lines remain parallel
- Ratios are preserved
- Closed under composition

- Python: `cv2.warpAffine`.

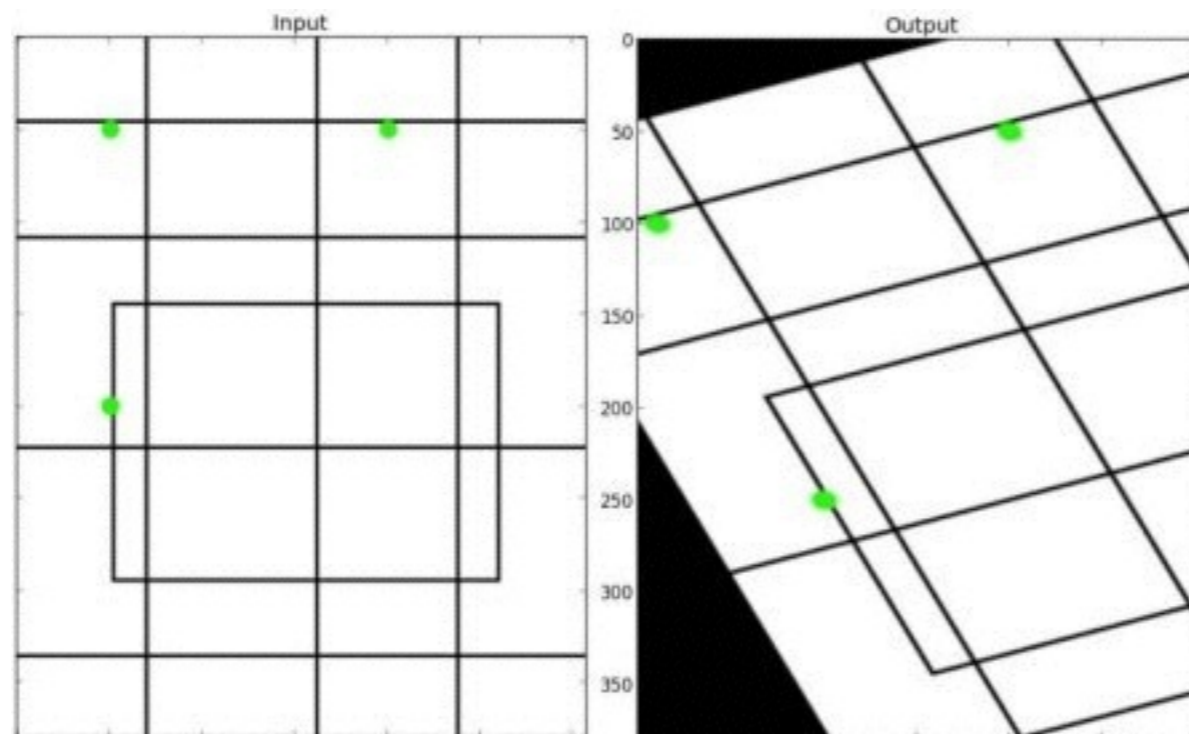

Affine Transformation Matrix

There are 6 unknowns in the matrix!

Once we specify 3 points, we can obtain transformation matrix M

Affine Transformation Matrix

- Euclidean: translation, rotation, reflection
- Similarity: translation, rotation, uniform scale, reflection
- Affine: linear transformations + translation

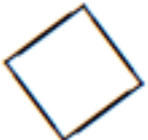

Transformation	Matrix	# DoF	Preserves	Icon
translation	$\begin{bmatrix} \mathbf{I} & & \mathbf{t} \end{bmatrix}_{2 \times 3}$	2	orientation	
rigid (Euclidean)	$\begin{bmatrix} \mathbf{R} & & \mathbf{t} \end{bmatrix}_{2 \times 3}$	3	lengths	
similarity	$\begin{bmatrix} s\mathbf{R} & & \mathbf{t} \end{bmatrix}_{2 \times 3}$	4	angles	
affine	$\begin{bmatrix} \mathbf{A} \end{bmatrix}_{2 \times 3}$	6	parallelism	
projective	$\begin{bmatrix} \tilde{\mathbf{H}} \end{bmatrix}_{3 \times 3}$	8	straight lines	

Table 2.1 Hierarchy of 2D coordinate transformations. Each transformation also preserves the properties listed in the rows below it, i.e., similarity preserves not only angles but also parallelism and straight lines. The 2×3 matrices are extended with a third $[\mathbf{0}^T \ 1]$ row to form a full 3×3 matrix for homogeneous coordinate transformations.

Homographies

Reading

- Szeliski: Chapter 3.6

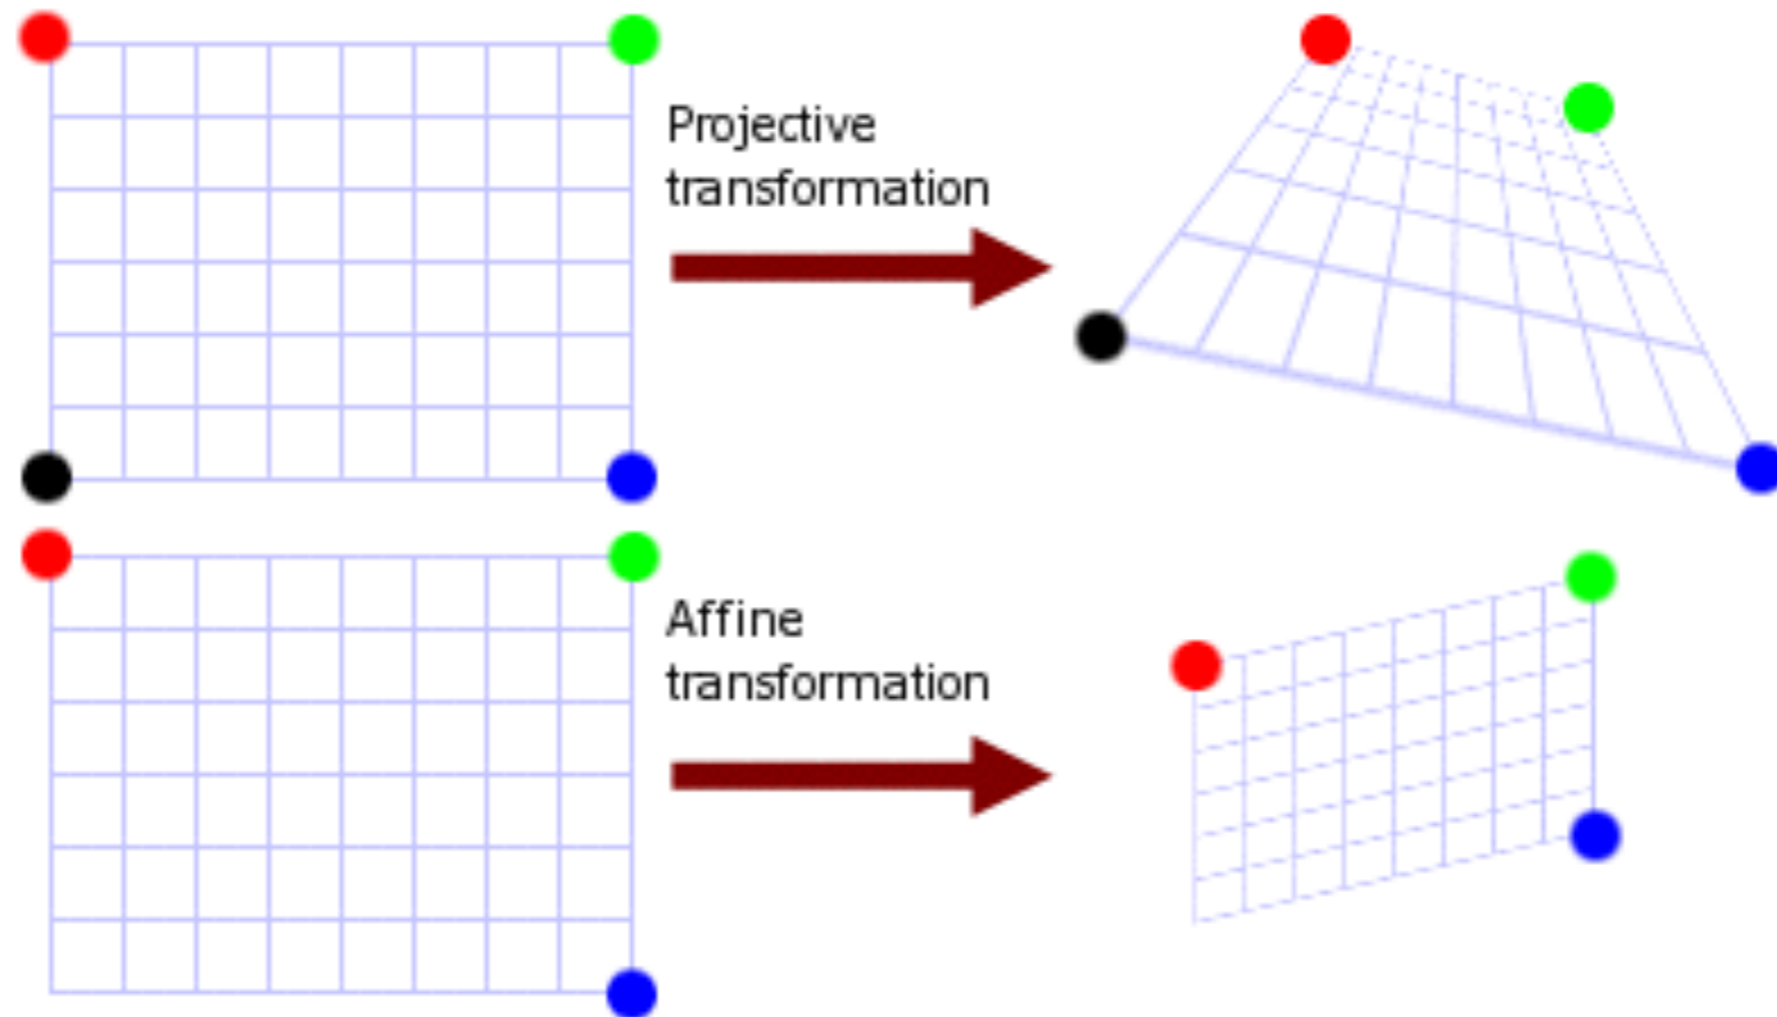

Is this an affine transformation?

Projective Transformations

Affine vs. Projective Transformations

Where do we go from here?

$$\begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix}$$

affine transformation

what happens when we
mess with this row?

Projective Transformations aka Homographies aka Planar Perspective Maps

$$\mathbf{H} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & 1 \end{bmatrix}$$

Called a *homography*
(or *planar perspective map*)

Why do we care?

- What is the relation between a plane in the world and a perspective image of it?
- Can we reconstruct another view from one image?
- Relation between pairs of images
 - Need to make a mosaic

Homographies is useful in overlay images

Automatic Sudoku solver

Requires
Image Wrapping

	3	9	1					
4		8		6				2
2			5	8		7		
8								
	2				9			
3	6						4	9
			1				3	
	4	3						8
7							4	

Homographies

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} ax + by + c \\ dx + ey + f \\ gx + hy + 1 \end{bmatrix}$$

Plane projection in drawing

Homographies

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} ax + by + c \\ dx + ey + f \\ gx + hy + 1 \end{bmatrix}$$
$$\sim \begin{bmatrix} \frac{ax + by + c}{gx + hy + 1} \\ \frac{dx + ey + f}{gx + hy + 1} \\ 1 \end{bmatrix}$$

Homographies

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

What happens when the denominator is 0?

$$\sim \begin{bmatrix} \frac{ax+by+c}{gx+hy+1} \\ \frac{dx+ey+f}{gx+hy+1} \\ 1 \end{bmatrix}$$

Points at infinity

black area where no pixel maps to

Homographies

Homographies

- Homographies ...

- Affine transformations, and
- Projective warps

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ w \end{bmatrix}$$

- Properties of projective transformations:

- Origin does not necessarily map to origin
- Lines map to lines
- Parallel lines do not necessarily remain parallel
- Ratios are not preserved
- Closed under composition

2D image transformations

Name	Matrix	# D.O.F.	Preserves:	Icon
translation	$\begin{bmatrix} \mathbf{I} & \mathbf{t} \end{bmatrix}_{2 \times 3}$	2	orientation + ...	
rigid (Euclidean)	$\begin{bmatrix} \mathbf{R} & \mathbf{t} \end{bmatrix}_{2 \times 3}$	3	lengths + ...	
similarity	$\begin{bmatrix} s\mathbf{R} & \mathbf{t} \end{bmatrix}_{2 \times 3}$	4	angles + ...	
affine	$\begin{bmatrix} \mathbf{A} \end{bmatrix}_{2 \times 3}$	6	parallelism + ...	
projective	$\begin{bmatrix} \tilde{\mathbf{H}} \end{bmatrix}_{3 \times 3}$	8	straight lines	

These transformations are a nested set of groups

- Closed under composition and inverse is a member

Affine transformations

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- How many unknowns?
- How many equations per match?
- How many matches do we need?

Affine transformations

- Matrix form

$$\begin{bmatrix} x_1 & y_1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & x_1 & y_1 & 1 \\ x_2 & y_2 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & x_2 & y_2 & 1 \\ \vdots & & & & & \\ x_n & y_n & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & x_n & y_n & 1 \end{bmatrix} \begin{bmatrix} a \\ b \\ c \\ d \\ e \\ f \end{bmatrix} = \begin{bmatrix} x'_1 \\ y'_1 \\ x'_2 \\ y'_2 \\ \vdots \\ x'_n \\ y'_n \end{bmatrix}$$

A **t** = **b**

$2n \times 6$ 6×1 $2n \times 1$

Homographies

To unwarp (rectify) an image

- solve for homography \mathbf{H} given \mathbf{p} and \mathbf{p}'
- solve equations of the form: $\mathbf{p}' = \mathbf{H}\mathbf{p}$

Next class: Image alignment

Python exercise

- Download the image rif1.gif from blackboard. Use the OpenCV demo code you got last lecture. Do the following exercise:
- 1. Apply a translation by moving the image origin (0,0) to (64,64)
- 2. A pure rotation requires re-mapping the position of two corners to new positions. If we specify that the lower-left corner moves to (256,0) and the lower-right corner moves to (256,256), we obtain
- 3. Swapping the image to perform reflection
- 4. Scaling can be applied by re-mapping just two corners For example, we can send the lower-left corner to (64,64), while pinning the upper-right corner down at (256,256), and thereby uniformly shrink the size of the image subject by a quarter, as shown in

Python exercise

- Download the image rif1.gif
- Do the following operations:
- 5. A general affine transformation is specified by re-mapping 3 points. If we re-map the input image so as to move the lower-left corner up to (64,64) along the 45 degree oblique axis, move the upper-right corner down by the same amount along this axis, and pin the lower-right corner in place, we obtain an image which shows some shearing effects

Computing transformations

Simple case: translations

How do we solve for
 (x_t, y_t) ?

(x_t, y_t)

Simple case: translations

Displacement of match $i = (x'_i - x_i, y'_i - y_i)$

$$(x_t, y_t) = \left(\frac{1}{n} \sum_{i=1}^n x'_i - x_i, \frac{1}{n} \sum_{i=1}^n y'_i - y_i \right)$$

Another view

$$\mathbf{x}_i + \mathbf{x}_t = \mathbf{x}'_i$$

$$\mathbf{y}_i + \mathbf{y}_t = \mathbf{y}'_i$$

- System of linear equations
 - What are the knowns? Unknowns?
 - How many unknowns? How many equations (per match)?
